

STT LOGISTICS GROUP

Mobile Application Project Overview

Driver verification, shipment management,
onboarding, and multi-language support

Version 1.0.0 | July 2026

Private delivery document

This document describes product capabilities, Firebase services, architecture, and representative screens from the iOS build. It is intended for product and technical stakeholders reviewing the 1.0 delivery.

1. Purpose

STT Logistics App is a Flutter mobile client for STT Logistics Group drivers. It provides secure sign-in, first-run onboarding, multi-language UI, CDL-style verification display, and day-to-day shipment management from a phone.

Release 1.0 stores accounts and shipments on-device with Hive. Firebase powers analytics, crash reporting, performance monitoring, and push notifications. The data layer is structured so a remote backend can replace local storage later without rewriting screens.

2. Product features

Area	What it does
Onboarding	Two-page brand introduction shown once for new installs
Language	First-run language picker; change anytime in Settings (15 locales)
Auth	Email/password register and login; hashed passwords; session restore
Home	Welcome header, shipment overview chart, verification card shortcut
Shipments	Create, edit, status update, delete; per-user isolation
Add FAB	Center + opens create form; one-time coach-mark tutorial
Driver card	License-style verification view (name, CDL, hub, status, photo)
Profile	Edit name, phone, CDL, hub, photo
Settings	Notifications toggle, language, privacy, terms, logout
Localization	English, Spanish, Mexican Spanish, German, Hindi, Gujarati, Japanese, French, Chinese, Korean, Vietnamese, Portuguese, Italian, Arabic, Filipino

3. User flow

- Splash restores session and routes by first-run flags.
- New users: Onboarding → Language → Login / Register → Main shell.
- Returning users: Splash → Login or Shell (if session valid).
- Shell tabs: Home | Shipments | Profile | Settings. Center red + adds a shipment.
- FAB tutorial appears once on first shell visit, then is never shown again.
- Logout clears session; that user's shipments remain on device for next login.

4. Firebase services

Firebase is initialized at startup. Each service has a focused role:

Service	Role in this app
Firebase Core	Initializes the Firebase app for all other SDKs
Analytics	Screen views, funnel events (splash, auth, shipments), user id binding
Crashlytics	Captures fatal/non-fatal crashes; associates reports with user email
Performance	Traces critical paths such as splash bootstrap
Cloud Messaging (FCM)	Push notifications; deep-link style route handling when enabled
Local notifications	Foreground presentation helper for FCM messages

Notification delivery can be turned off from Settings; MessagingService respects that preference. Analytics and Crashlytics remain available for operational insight.

5. Architecture

Stack: Flutter, GetX, Hive, Firebase. Layering: **View** → **Controller** → **Repository** → **Provider / AuthApi** → **Hive**. App-wide services handle auth session, settings, analytics, messaging, and performance.

Hive boxes

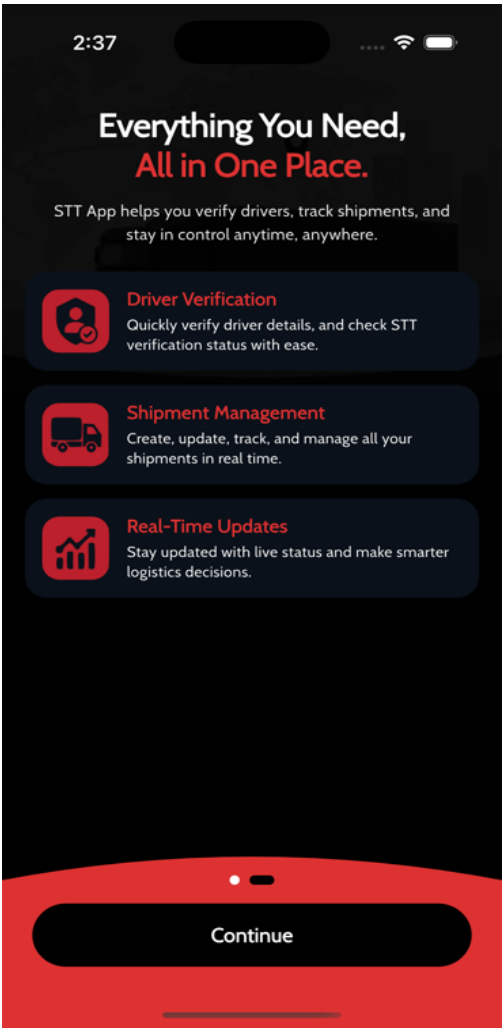

Box	Contents
users	Accounts (email, password hash, profile)
drivers	CDL, hub, phone, photo, verification status
session	Active login
settings	Notifications, locale, onboarding/language/FAB flags
shipments	Per-user shipment records

6. Delivery facts

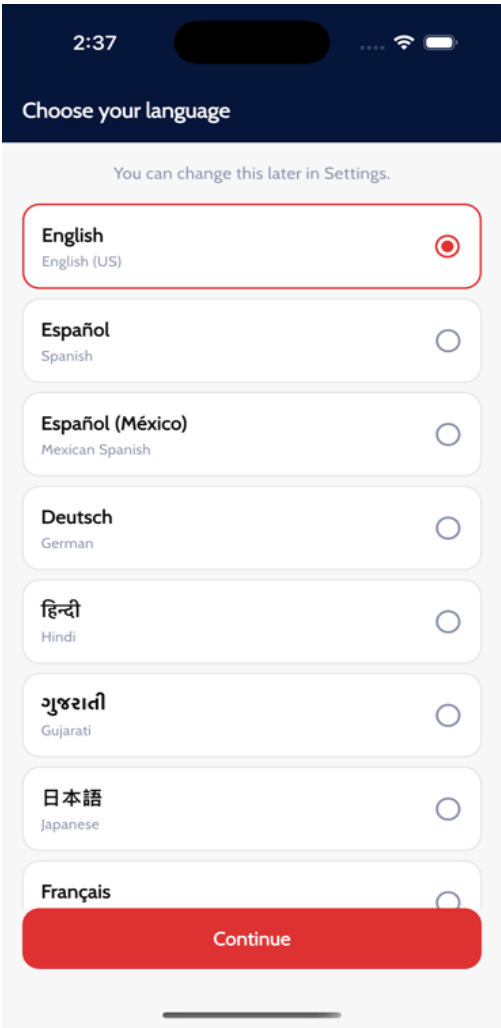

Item	Detail
Version	1.0.0+1
Package ID	com.sttlogistics.group
Orientation	Portrait
Brand	Navy #06163A, accent red #DE3232
Platforms	iOS and Android

7. Application screens (iOS)

Screens captured from the iOS Simulator build. Layout may vary slightly by device size.

8. Build and handoff

```
flutter pub get  
flutter run  
flutter analyze  
flutter test
```

Firebase must be configured via `lib/firebase_options.dart`. Brand and onboarding assets live under `assets/images/`. See `README.md` for screenshots and a full feature list.

9. Scope notes

This release is a complete driver-facing client on local data. It does not include a company admin portal or remote shipment API. When a backend is available, replace `AuthApi` and shipment providers; screens and navigation can stay largely the same.

Prepared for STT Logistics Group. Screenshots and source are packaged with this delivery.
